"Momordin II, a ribosome inactivating protein from Momordica
"Momordin II, a ribosome inactivating protein from Momordica
balsamina, is homologous to other plant proteins.";
Nucleic Acids Res. 20.4662-4662(1992).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
specific adenosine on the 28S rRNA.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
Type I RIP subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                EIAIDVTSVYVVGYQVRNRSYFFKDAPDAAYEGLFKNTIKTRLHFGGSYPSLE-GEKAYR

                                 CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
                                              specific adenosine on the 28S rRNA.

PIT: Bound to a branched hexasaccharide.

MINGCELLANBOUS: Manganese or zinc required for enhancing substrate binding rather than catalysis.

MINGCELLANBOUS: The oligosaccharide does not influence the fold of the polypeptide chain and probably does not play a role in the enzymatic function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PROSITE; PS00275; SHIGA RICIN; 1.

Type I RIP gelonin analog Gel (A44/A50)

Type I ribosome-inactivating proteins; RIPs; gelonin; cytotoxic therapeutic agents; autoimmune disease; cancer; graft-versus-host disease.

WO9426910-A1

24-NOV-1994.

93US-00064691. 12-MAY-1993;

Better MD, Carroll SF, Studnicka GM;

which Polynucleotide(s) encoding type I ribosome-inactivating proteins - are suitable for use as components of cytotoxic therapeutic agents. AAR63912-R63924 are analogs of AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. RIPs are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is tragetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)

Gelonium multiflorum

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RIPs are key components of cytotoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-WAR-2003 to correct PN field.)

AAQ75532 encodes AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. RIPs are key components of cyctoxic therapeutic agents (CTA91), which include gene fusion products and immunoconjugates. CTA9 may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  - which

The invention describes an isolated peptide or polypeptide having an antitumour and antiviral activity. Also described is a composition comprising the isolated peptide or polypeptide, and a carrier, excipient or auxiliary agent. Specifically claimed are MAP30 or GAP31 peptides or polypeptide. The peptide or polypeptide is useful for treating HIV infection, and tumour. This is the amino acid sequence of Gelonium anti-HIV protein 30kDa (MAP30).

RIPs are key components of cytocoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-WAR-2003 to

c subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example galonin toxin derived from Gelonium multiflorum, that are truncated condoni toxin derived from Gelonium multiflorum, that are truncated and/or possess reduced antigenicity. Such designar toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic, bone, bone marrow, head and neck, cervical, oesophagus, eye, gall consistions of the invention are also useful for treating microbial pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune diseases, hyperproliferative disorders including cancer, leukaemias, arthritis, inflammatory diseases, cardiovascular diseases, pathogenic arthritis, inflammatory diseases, which are more effective than prior art. The peptides and polypeptides, which are more effective than prior art. The present sequence represents G. multiflorum recombinant gelonin (rGel)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           106

The present invention relates to a method of generating a modified protein with reduced antigenicity while maintaining its biological activity. The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first cubject or a second subject using antiserum from either the first subject. In particular the invention discloses modified toxin compounds, for example gelonin toxin derived from Gelonium multiflorum, that are truncated and/or possess reduced antigenicity. Such designer toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, contended and neck, cervical, oseophagus, eye, gall chone, bone marrow, head and neck, cervical, oseophagus, eye, gall chance, bone marrow, head and neck, cervical, oseophagus, eye, gall charder, kidney, adrenal glands, heart, colon, or blood cancer. The pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune diseases, hyperproliferative disorders including cancer, leukaemias, arthritis, inflammatory diseases, cardiovascular diseases, pathogenic diseases, and diabetes. The method provides less antigenic proteins, peptides and polypeptides, which are more effective than prior art. The present sequence represents murine single-chain ZME-018 antibody/G. comultiflorum recombinant gelonin (rGel) (scfWMEL/rGel) fusion protein

RESULT 8

```
A new recombinant DNA vector construct has been developed which encodes a fusion protein and is suitable for introduction into a bacterial host.

The vector comprises: (a) DNA encoding at least one cationic bactericidal/permeability increasing peptide (BPI), (b) DNA encoding a carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site coarded between (a) and (b). The present sequence represents the protein from the pING3797 vector construct which codes for a BPI fusion protein. The peptides have many uses including the treatment of bacterial and contralising their effects. The peptides also bind to endotoxins and heparin, neutralising their effects. The peptides save further been shown to inhibit anglogenesis (partly due to heparin-binding activity). The fusion proteins have been found to be expressed in large amounts without significant proteolysis, and in some cases are actually secreted from the coeffides in microbial hosts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A new recombinant DNA vector construct has been developed which encodes a fusion protein and is suitable for introduction into a bacterial host. The vector comprises: (a) DNA encoding at least one cationic bactericidal/permeability increasing peptide (BPI), (b) DNA encoding a carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site located between (a) and (b). The present sequence represents the protein from the pING3795 vector construct which cased for a BPI fusion protein. The peptides have many uses including the treatment of bacterial and fungal infections. BPI peptides also bind to endotoxins and heparin, neutralising their effects. The peptides have further been shown to inhibit anglogenesis (partly due to heparin-binding activity). The fusion proteins have been found to be expressed in large amounts without
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            significant proteolysis, and in some cases are actually secreted from the host cells. This allows the indirect production of anti-microbial BPI peptides in microbial hosts

The vector comprises: (a) DNA encoding at least one cationic carrier protein and is suitable for introduction into a bacterial host.

The vector comprises: (a) DNA encoding at least one cationic carrier protein, and (c) DNA encoding an amino acid (as) cleavage site located between (a) and (b). The present sequence represents the protein from the plusion protein. The peptides have many uses including the treatment of bacterial and fungal infections. BPI peptides also bind to endotoxins and heparin, neutralising their effects. The peptides have further been shown to proteins have been found to be expressed in large amounts without significant proteolysis, and in some cases are actually secreted from the peptides in microbial hosts

RIPs are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is trargetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to

RIPs are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune
                                                                                                                                                            9
                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide(8) encoding type I ribosome-inactivating proteins - which are suitable for use as components of cytotoxic therapeutic agents.

RIPs are key components of cytotoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of

RIPs are key components of cytchcoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the
   cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to

RIPs are key components of cytotoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to selectively eliminate any cell type to which a RIP component is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                          Sequence 59, Application US/08425336
Patent No. 5621083
GENERAL INFORMATION
APPLICANT: Better, Marc D.
APPLICANT: Carroll, Stephen F.
APPLICANT: Studnika, Gary M.
TITLE OF INVENTION: Immunotoxins Comprising Ribsome-Inactivating
TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 140
CORRESPONDENCE ADDRESS:
ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Borun
STREET: 6300 Sears Tower, 233 South Wacker Drive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 59, Application US/09711485
Patent No. 6649742
GENERAL INFORMATION:
APPLICANT: Beteer, Marc D.
APPLICANT: Carroll, Stephen F.
APPLICANT: Studnika, Gary M.
TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 169
CORRESPONDENCE ADDRESS:
ADDRESSEE: MANDAGRAWS, Held & Malloy, Ltd.

| Patent No. 668980 |
| APPLICANT: Monsanto Technology LLC |
| APPLICANT: Applicant Meather and Methods |
| APPLICANT: Alou, Hua-Ping |
| APPLICANT: Alou, Hua-Ping |
| TITLE OF INVENTION: Glyphosate Tolerant Wheat Plant 33391 and Compositions and Methods |
| TITLE OF INVENTION: Glyphosate Tolerant Wheat Plant 33391 and Compositions and Methods |
| TITLE OF INVENTION: Glyphosate Tolerant Wheat Plant 33391 and Compositions and Methods |
| TITLE OF INVENTION: Glyphosate Tolerant Wheat Plant 33391 and Compositions and Methods |
| TITLE OF INVENTION: Glyphosate Tolerant Wheat Plant 33391 and Compositions and Methods |
| TITLE OF INVENTION: Glyphosate Tolerant Wheat Plant 33391 and Compositions and Methods |
| TITLE OF INVENTION: Glyphosate Tolerant Wheat Plant 33391 and Compositions and Methods |
| TITLE OF INVENTION: Glyphosate Tolerant Wheat Plant 33391 and Compositions and Methods |
